

# Hack Windows XP Login Password

**You can [hack Windows XP password](#) with a built-in Administrator.**

For many computer users, it may not be strange to know that Windows XP has a built-in security feature. Actually this built-in security feature is a user account for the Windows XP system administrator which is the first account created during operating system installation. It has highest administrative privilege over the system but by default it is visible and only accessible in the Safe Mode.

Another feature of this administrator is that it has no password protected for it by default. If you forgot Windows XP password and didn't do any change for the settings of this administrator, then you can be able to access to your Windows XP machine with this account. Below is how to hack Windows XP administrator password with the Windows built-in administrator.

Step1: Start computer and then press "Ctrl+Alt+Delete" twice at Windows Login Screen.

Step2: Type "Administrator" without quotations in the username box and leave password box blank. Then hit "Enter" to log onto Windows system.

Step3: Go to "Start->Control Panel->User Accounts" to change or reset the forgotten Windows XP login password.

## **Hack password Windows XP with Windows Password Recovery Standard.**
